

// Q1:

The result will be:

hey from message

“The bean is recognized by the spring container because the annotation @bean”

// Q2:

The result will be:

hey from message1

hey from message2

“The two beans are recognized by the spring container because the annotation @bean, so we can notice that we passed the qualifier 1 into the getMessage2 as a parameter, but we did not print it so it will not be showed, we have another text print which is the one will be showed”

// Q3:

The result will be:

hey from message1

hey from message3

hey from message2

or

hey from message3

hey from message2

hey from message1

or

hey from message3

hey from message1

hey from message2

“The three beans are recognized by the spring container because the annotation @bean, we can notice that the implementation from up to down first it prints the hey from message1 then it will first need to print getMessage3 then getMessage2 because message 2 depends on message 3 based on the qualifier or will start with getMessage3 then getMessage2 after that getMessage1”

// Q4:

The result will be:

hey from message1

hey from message3

hey from message2

hey from main controller

or

hey from message1

hey from main controller

hey from message3

hey from message2

or

hey from message3

hey from message2

hey from message1

hey from main controller

or

hey from message1

hey from message3

hey from Main controller

hey from message2

or

hey from message3

hey from message1

hey from Main controller

hey from message2

or

hey from message3

hey from message1

hey from message2

hey from Main controller

“The three beans are recognized by the spring container because the annotation @bean, for the main controller we used with its class @component annotation which will be considered as a general bean class”

// Q5:

The result will be:

hey from message3

hey from message2

hey from main controller

hey from message1

so here it is like a chain everything depends on each other.
